# Chapter 1 Overview

## 1.1 Introduction

The video intercom is a stand-alone intercom system used to manage calls made at the entrance to a building (e.g., residential complex, detached family home, workplace, etc.) with access controlled by audiovisual communication between the inside and outside. This manual introduces the typical applications (e.g., starting video intercom, ring management, and so on) and video intercom APIs of device network SDK (hereafter referred to as "HCNetSDK").

## Chapter 2 Start Video Intercom

The interaction between video intercom device and software client depends on the persistent connection. The video and audio data will be sent or received via the connection to realize the video intercom.

### Before You Start

- Make sure you have called [NET\\_DVR\\_Init](#) to initialize the development resources.
- Make sure you have called [NET\\_DVR\\_Login\\_V40](#) to log in to device.

## Steps

**Figure 2-1 Programming Flow of Starting Video Intercom**

1. **Optional:** Call **NET\_DVR\_GetDeviceAbility** and set **dwAbilityType** to "IP\_VIEW\_DEV\_ABILITY" (macro definition value: 0x014) to get video intercom device capability for checking the supported video intercom parameters.  
The video intercom device capability is returned in the message **XML\_IpViewDevAbility**, and the related node is <VideoCall>.
2. Call **NET\_DVR\_StartRemoteConfig** with  
**NET\_DVR\_VIDEO\_CALL\_SIGNAL\_PROCESS**  
(command No.: 16032) and set **lpInBuffer** to **NET\_DVR\_VIDEO\_CALL\_COND** for enabling persistent connection to start video intercom and registering callback function (**fRemoteConfigCallback**) to return connection status or related data.

The macro definition value of connection status (i.e., 0, 1, or 2) and related data (i.e., status value (1000, 1001, 1002), progress value, or data structure **NET\_DVR\_VIDEO\_CALL\_PARAM**) are returned by **dwType** and **lpBuffer**, respectively, in the callback function.

3. Call **NET\_DVR\_SendRemoteConfig**, set **dwDataType** to "0", and set **pSendBuf** to **NET\_DVR\_VIDEO\_CALL\_PARAM** for transmitting video intercom data.
4. Call **NET\_DVR\_StopRemoteConfig** to disable the persistent connection and stop video intercom.

### What to do next

Call **NET\_DVR\_Logout** and **NET\_DVR\_Cleanup** to log out of the device and release the development resources.

# Chapter 3 Manage Ring

## Before You Start

- Make sure you have called **NET\_DVR\_Init** to initialize the development resources.
- Make sure you have called **NET\_DVR\_Login\_V40** to log in to device.

## Steps

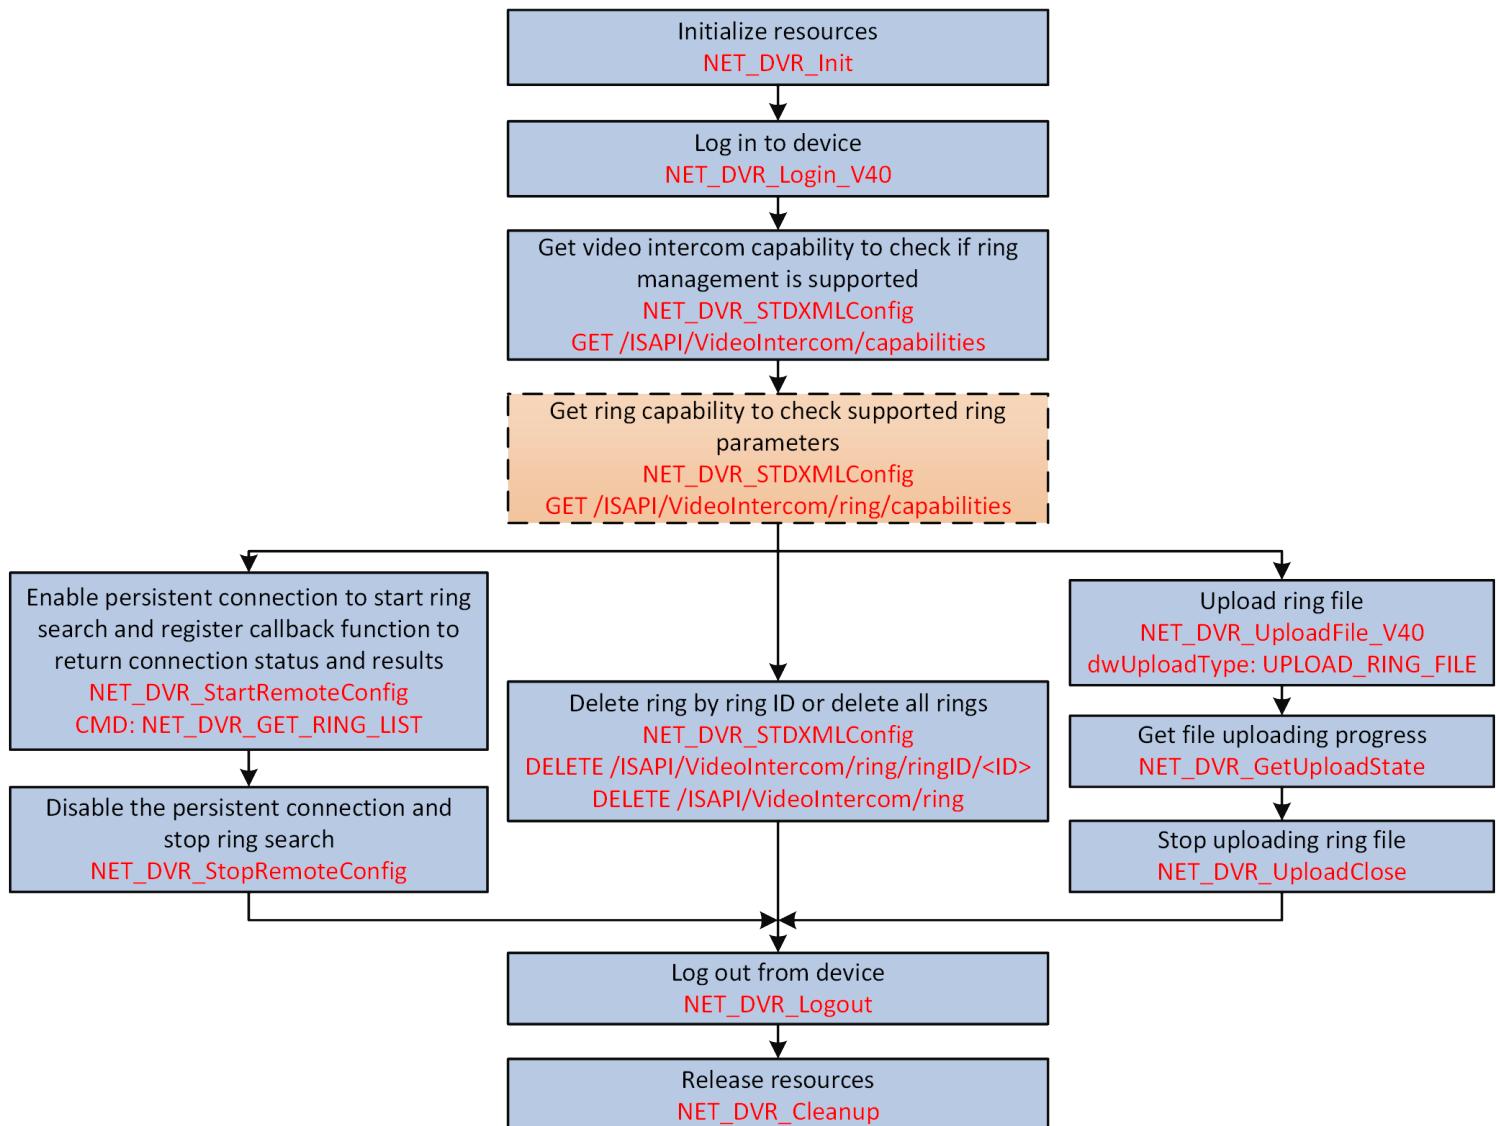

Figure 3-1 Programming Flow of Managing Ring

1. Call **NET\_DVR\_STDXMLConfig** to pass through the request URL: **GET /ISAPI/Videointercom/capabilities** for getting video intercom capability to check if ring management is supported.

The video intercom capability is returned in the message [XML\\_VideoIntercomCap](#) by [IpOutputParam](#).

If supports, the node <[isSupportRingManage](#)> is returned and its value is "true", and then you can perform the following steps.

Otherwise, ring management is not supported by device, please end this task.

2. **Optional:** Call [NET\\_DVR\\_STDXMLConfig](#) to pass through the request URL: GET [/ISAPI/VideoIntercom/ring/capabilities](#) for getting ring capability to check the supported ring configuration parameters.

The ring capability is returned in the message [XML\\_Cap\\_RingParam](#) by [IpOutputParam](#).

3. Perform the following operation(s) to manage ring, such as ring search, deleting rings, and uploading ring file.

- |             |   |
|-------------|---|
| Ring Search | a. Call <a href="#"><u>NET_DVR_StartRemoteConfig</u></a> with<br><a href="#"><u>NET_DVR_GET_RING_LIST</u></a><br>(command No.: 16039) and set <a href="#"><u>IpInBuffer</u></a> to <a href="#"><u>NET_DVR_RING_SEARCH_COND</u></a> for enabling persistent connection to start ring search and registering callback function ( <a href="#"><u>fRemoteConfigCallback</u></a> ) to return connection status and search results. |
|-------------|---|
- 

The macro definition value of connection status (i.e., 0 or 2) and related data (i.e., status value (1000, 1001, 1002) or search result structure ([NET\\_DVR\\_RING\\_SEARCH\\_CFG](#))) are returned by [dwType](#) and [IpBuffer](#), respectively, in the callback function.

- |                        |   |
|------------------------|---|
| Delete Ring by Ring ID | b. Call <a href="#"><u>NET_DVR_StopRemoteConfig</u></a> to disable the persistent connection and stop ring search when the called back status value is "1000".  |
| Delete All Rings       | Call <a href="#"><u>NET_DVR_STDXMLConfig</u></a> to pass through the request URL: DELETE <a href="#"><u>/ISAPI/VideoIntercom/ring/ringID/&lt;ID&gt;</u></a> .   |
| Upload Ring File       | a. Call <a href="#"><u>NET_DVR_UploadFile_V40</u></a> , set <a href="#"><u>dwUploadType</u></a> to "UPLOAD_RING_FILE" (macro definition value: 20), and set <a href="#"><u>IpOutBuffer</u></a> to <a href="#"><u>NET_DVR_RING_UPLOAD_CFG</u></a> for uploading ring file.<br>b. Call <a href="#"><u>NET_DVR_GetUploadState</u></a> to get file uploading progress.<br>c. Call <a href="#"><u>NET_DVR_UploadClose</u></a> to stop uploading ring file when the returned uploading progress is "100". |

### What to do next

Call [NET\\_DVR\\_Logout](#) and [NET\\_DVR\\_Cleanup](#) to log out of the device and release the development resources.

### What to do next

Call **NET\_DVR\_Logout** and **NET\_DVR\_Cleanup** to log out of the device and release the development resources.

# Chapter 6 Alarm/Event Receiving

The alarm/event information from the device can be received in third-party platform or system when the alarms are triggered or event occurred. Two modes are available for receiving alarms, including arming mode and listening mode.

## Arming Mode

The third-party platform connects to device automatically, when the alarm is triggered, the platform sends alarm uploading command to the device, and then the device will upload the alarm to the platform.

## Listening Mode

When alarm is triggered, the device automatically uploads the alarm, and then the third-party platform receives the uploaded alarm via the configured listening host (listening address and port should be configured). This mode is applicable for multiple devices uploading alarm/event information to one third-party platform without logging in to devices, and the restart of devices will not affect the alarm/event uploading. But a device can only support the configuration of one or two listening addresses and ports.

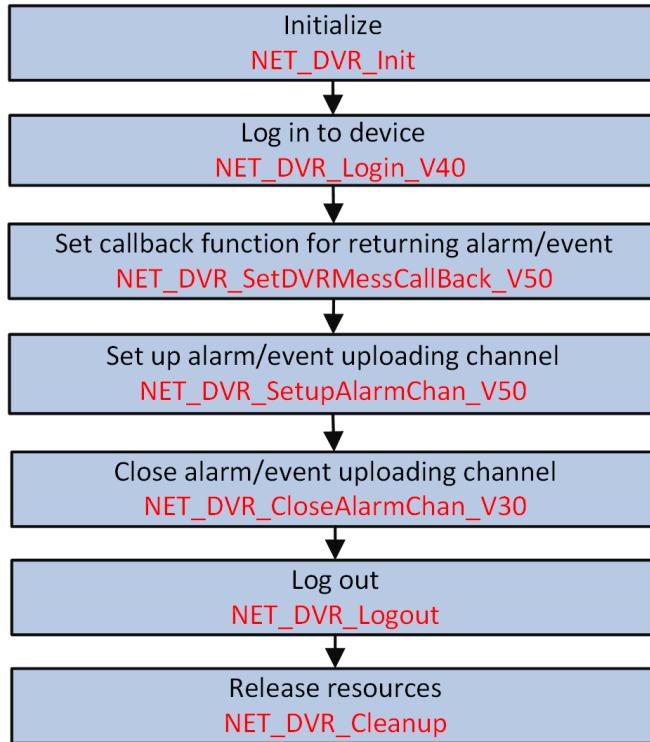

## 6.1 Receive Alarm/Event in Arming Mode

When the alarm is triggered or the event occurred, the secondarily developed third-party platform can automatically connect and send alarm/event uploading command to the device, and then the device uploads the alarm/event information to the platform for receiving.

### Before You Start

- Make sure you have called [NET\\_DVR\\_Init](#) to initialize the development environment.
- Make sure you have called [NET\\_DVR\\_Login\\_V40](#) to log in to the device.
- Make sure you have configured the alarm/event parameters, refer to the typical alarm/event configurations for details.

## Steps

**Figure 6-1 Programming Flow of Receiving Alarm/Event in Arming Mode**

1. Call [NET\\_DVR\\_SetDVRMessageCallBack\\_V50](#) to set callback function for returning alarm/event information.

- If the configured alarm is triggered or event occurred, the alarm/event information will be uploaded by device and returned in the callback function. You can view the alarm/event and do some processing operations.
- For the integration via device network SDK (HCNetSDK), to receive different types of alarm/event information, the parameter **ICommand** (data type to be uploaded) in the configured callback function should be different (refer to the typical alarm/event configurations). For the integration via text protocol, the **ICommand** should be set to "COMM\_ISAPI\_ALARM" (command No.: 0x6009) and the input parameter **pAlarmInfo** in the callback function [MSGCallBack](#) should be set to [NET\\_DVR\\_ALARM\\_ISAPI\\_INFO](#).

2. Call [NET\\_DVR\\_SetupAlarmChan\\_V50](#) to set up uploading channel.
3. Call [NET\\_DVR\\_CloseAlarmChan\\_V30](#) to close uploading channel and stop receiving alarm or event information.

## Example

```
#include <stdio.h>
#include <iostream>
#include "Windows.h"
#include "HCNetSDK.h"
using namespace std;

void main() {
//-----
// Initialize
NET_DVR_Init();
//Set connection time and reconnection time
NET_DVR_SetConnectTime(2000, 1);
NET_DVR_SetReconnect(10000, true);

struLoginInfo.bUseAsynLogin = 0; //Synchronous login mode
strcpy(struLoginInfo.sDeviceAddress, "192.0.0.64"); //Device IP address
struLoginInfo.wPort = 8000; //Service port No.
strcpy(struLoginInfo.sUserName, "admin"); //User name
strcpy(struLoginInfo.sPassword, "abcd1234"); //Password
//Device information, output parameter
NET_DVR_DEVICEINFO_V40 struDeviceInfoV40 = {0};
lUserID = NET_DVR_Login_V40(&struLoginInfo, &struDeviceInfoV40);
if (lUserID < 0)
{
printf("Login failed, error code: %d\n", NET_DVR_GetLastError());
NET_DVR_Cleanup();
return;
}

//Set alarm callback function
NET_DVR_SetDVRMessageCallBack_V50(0, MessageCallbackNo1, NULL);
NET_DVR_SetDVRMessageCallBack_V50(1, MessageCallbackNo2, NULL);

//Enable arming
NET_DVR_SETUPALARM_PARAM_V50 struSetupParamV50={0};
struSetupParamV50.dwSize=sizeof(NET_DVR_SETUPALARM_PARAM_V50);
//Alarm category to be uploaded
struSetupParamV50.byAlarmInfoType=1;
//Arming level
struSetupParamV50.byLevel=1;

char szSubscribe[1024] = {0};
//The following code is for alarm subscription (subscribe all)
memcpy(szSubscribe, "<SubscribeEvent version=\"2.0\" xmlns=\"http://www.isapi.org/ver20/XMLSchema\">\r\n<eventMode>all</eventMode>\r\n", 1024);
LONG lHandle = -1;
if (0 == strlen(szSubscribe))
{
```

```
//Arm
IHandle = NET_DVR_SetupAlarmChan_V50(lUserID, &struSetupParamV50, NULL, strlen(szSubscribe));
}
else
{
//Subscribe
LIHandle = NET_DVR_SetupAlarmChan_V50(lUserID, &struSetupParamV50, szSubscribe, strlen(szSubscribe));
}

if (IHandle < 0)
{
printf("NET_DVR_SetupAlarmChan_V50 error, %d\n", NET_DVR_GetLastError());
NET_DVR_Logout(lUserID);
NET_DVR_Cleanup();
return;
}

Sleep(20000);
//Disarm the uploading channel
if (!NET_DVR_CloseAlarmChan_V30(IHandle))
{
printf("NET_DVR_CloseAlarmChan_V30 error, %d\n", NET_DVR_GetLastError());
NET_DVR_Logout(lUserID);
NET_DVR_Cleanup();
return;
}

//Log out
NET_DVR_Logout(lUserID);
//Release resources
NET_DVR_Cleanup();
return;
}
```

### What to do next

Call [NET\\_DVR\\_Logout](#) and [NET\\_DVR\\_Cleanup](#) to log out and release resources.

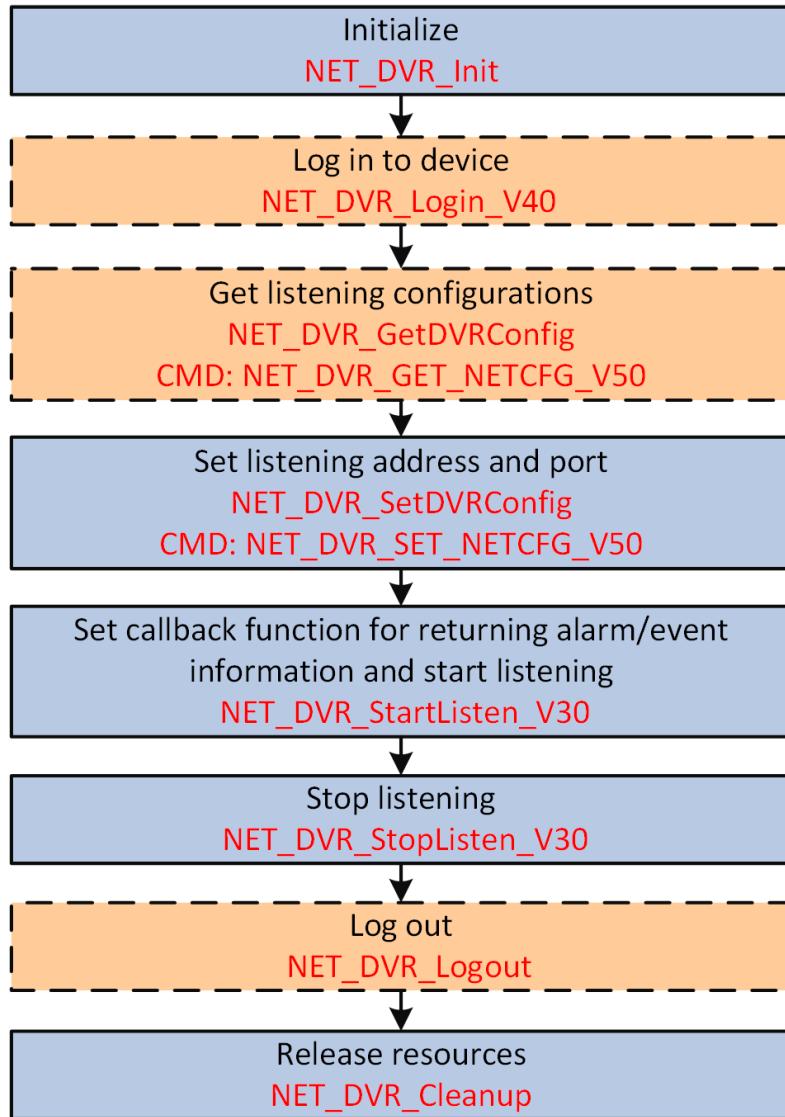

## 6.2 Receive Alarm/Event in Listening Mode

When alarm is triggered or event occurred, the device uploads the alarm/event information automatically, so you can configure the listening address and port for listening and receiving the alarm/event in the secondarily developed third-part platform.

### Before You Start

- Make sure you have called [NET\\_DVR\\_Init](#) to initialize the development environment.
- Make sure you have configured the alarm/event parameters, refer to the typical alarm/event configurations for details.

## Steps

**Figure 6-2 Programming Flow of Receiving Alarm/Event in Listening Mode**

1. **Optional:** Call [NET\\_DVR\\_Login\\_V40](#) to log in to device.
2. **Optional:** Call [NET\\_DVR\\_GetDVRConfig](#) with "NET\_DVR\_GET\_NETCFG\_V50" (command No.: 1015) to get the existing listening configurations (i.e., listening address and port) for reference. The listening parameters are retruned in the structure [NET\\_DVR\\_NETCFG\\_V50](#) by the output parameter pointer **lpOutBuffer**.
3. Call [NET\\_DVR\\_SetDVRConfig](#) with "NET\_DVR\_SET\_NETCFG\_V50" (command No.: 1016) and specify the input parameter pointer **lpInBuffer** to the structure [NET\\_DVR\\_NETCFG\\_V50](#) for setting the listening address and port.
4. Call [NET\\_DVR\\_StartListen\\_V30](#) to set callback function for returning alarm/event information and start the listening.

## Note

For the integration via device network SDK (HCNetSDK), to receive different types of alarm/event information, the parameter **ICommand** (data type to be uploaded) in the configured callback function should be different (refer to the typical alarm/event configurations). For the integration via text protocol, the **ICommand** should be set to "COMM\_ISAPI\_ALARM" and the input parameter **pAlarmInfo** in the callback function **MSGCallBack** should be set to **NET\_DVR\_ALARM\_ISAPI\_INFO**.

---

The alarm/event information is automatically uploaded by the device when the configured alarm is triggered or event occurred, and the third-party platform or system gets the alarm/event information from the configured callback function.

5. Call **NET\_DVR\_StopListen\_V30** to stop listening and receiving alarm or event information.

### Example

#### Sample Code of Receiving Alarm/Event in Listening Mode

```
#include <stdio.h>
#include <iostream>
#include "Windows.h"
#include "HCNetSDK.h"
using namespace std;
void main() {
    //-----
    // Initialize
    NET_DVR_Init();
    //Set connection time and reconnection time
    NET_DVR_SetConnectTime(2000, 1);
    NET_DVR_SetReconnect(10000, true);
    //-----
    // Log in to device
    LONG lUserID;
    NET_DVR_DEVICEINFO_V30 struDeviceInfo;
    lUserID = NET_DVR_Login_V30("172.0.0.100", 8000, "admin", "12345", &struDeviceInfo);
    if (lUserID < 0)
    {
        printf("Login error, %d\n", NET_DVR_GetLastError());
        NET_DVR_Cleanup();
        return;
    }
    //Enable listening
    LONG lHandle;
    lHandle = NET_DVR_StartListen_V30(NULL, 7200, MessageCallback, NULL);
    if (lHandle < 0)
    {
        printf("NET_DVR_StartListen_V30 error, %d\n", NET_DVR_GetLastError());
        NET_DVR_Logout(lUserID);
        NET_DVR_Cleanup();
        return;
    }
    Sleep(5000);}
```

```
//Disable listening
if (!NET_DVR_StopListen_V30(lHandle))
{
    printf("NET_DVR_StopListen_V30 error, %d\n", NET_DVR_GetLastError());
    NET_DVR_Logout(lUserID);
    NET_DVR_Cleanup();
    return;
}
//Log out
NET_DVR_Logout(lUserID);
//Release SDK resource
NET_DVR_Cleanup();
return;
}
```

### What to do next

Call [NET\\_DVR\\_Logout](#) (if logged in) and [NET\\_DVR\\_Cleanup](#) to log out and release resources.

    LPVOID  lpOutBuffer,  
    DWORD   dwOutBufferSize  
) ;
```

### **Parameters**

#### **lUserID**

[IN] Value returned by [\*\*\*NET\\_DVR\\_Login\\_V40\*\*\*](#).

#### **dwCommand**

[IN] Device getting commands. The commands are different for different getting functions.

#### **dwCount**

[IN] Number of configurations (cameras) to get at a time. 0, 1-one camera, 2-two cameras, 3-three cameras, and so on. Up to 64 cameras' configuration information can be obtained at a time.

## IpInBuffer

[IN] Pointer of configuration condition buffer, which specifies the number (**dwCount**) of configurations to get, and relates to the getting commands.

The following error codes may be returned by this API: 0, 3, 6, 7, 8, 9, 10, 12, 17, 41, 43, 44, 47, 72, 73, and 76. See the corresponding error types and descriptions in the [Device Network SDK Errors](#).

## 10.24 NET\_DVR\_SetDVRMessageCallBack\_V50

Set callback functions for getting the video data.

### API Definition

```
BOOL NET_DVR_SetDVRMessageCallBack_V50(
    int      iIndex,
    MSGCallBack  fMessageCallBack,
    void     *pUser
);
```

### Parameters

#### iIndex

[IN] Callback function index No., which ranges from 0 to 15.

#### fMessageCallBack

[IN] Callback function, see details in [MSGCallBack](#) .

#### pUser

[IN] User data.

### Return Values

Return *TRUE* for success, and return *FALSE* for failure.

If *FALSE* returned, call [NET\\_DVR\\_GetLastError](#) to get the error code.

### Remarks

- This API supports setting multiple callback functions for different channels (up to 16 channels are supported) at same time, and the configured callback functions are distinguished by the index No.
- All alarm/event information will be returned in each configured callback function, and you can distinguish the devices via the **pAlarmInfo** in the callback function ([MSGCallBack](#) ).

### Example

Sample Code of Setting Multiple Callback Functions to Receive Different Alarms/Events in Arming Mode

```
#include <stdio.h>
#include <iostream>
#include "Windows.h"
#include "HCNetSDK.h"
using namespace std;

```

```
int i=0;
char filename[100];
FILE *fSnapPic=NULL;
FILE *fSnapPicPlate=NULL;

//This sample code is for reference only. Actually, it is not recommended to process the data and save file in the
callback function directly.
//You'd better process the data in the message response funcion via message mode (PostMessage).

### 10.24.1 MSGCallBack

Alarm/event information callback function.

#### Callback Function Definition

```
typedef void(CALLBACK *MSGCallBack)(
    LONG      ICommand,
    NET_DVR_ALARMER  *pAlarmer,
    char      *pAlarmInfo,
    DWORD     dwBufLen,
    void      *pUser
);
```

#### Parameters

##### ICommand

[OUT] Uploaded message type. You can distinguish the alarm/event information via the type.

##### pAlarmer

[OUT] Alarm device information, including serial No., IP address, login handle, and so on, see details in [NET\\_DVR\\_ALARMER](#).

##### pAlarmInfo

[OUT] Alarm/event information, the details are returned in different structures according to **ICommand**.

##### dwBufLen

[OUT] Size of alarm/event information buffer.

##### pUser

[OUT] User data.

## 10.25 NET\_DVR\_SetupAlarmChan\_V50

Set up persistent connection to receive alarm/event information (supports alarm/event subscription).

### API Definition

```
LONG NET_DVR_SetupAlarmChan_V50(
    LONG          IUserID,
    NET_DVR_SETUPALARM_PARAM_V50  IpSetupParam,
    char          *pData,
    DWORD         dwDataLen,
);
```

### Parameters

#### IUserID

[IN] Value returned by [NET\\_DVR\\_Login\\_V40](#).

#### IpSetupParam

[IN] Arming parameters, refer to the structure [NET\\_DVR\\_SETUPALARM\\_PARAM\\_V50](#) for details.

#### pData

[IN] Alarm/event subscription conditions.

#### dwDataLen

[IN] Length of alarm/event subscription conditions.

### Return Values

Return -1 for failure, and return other values as the handles of [NET\\_DVR\\_CloseAlarmChan\\_V30](#). If -1 is returned, you can call [NET\\_DVR\\_GetLastError](#) to get the error code.

### Remarks

This API supports alarm/event subscription, you can specify the types of alarm or event to be uploaded by device by setting **pData** and **dwDataLen**.

## 10.26 NET\_DVR\_StartListen\_V30

Register callback function for receiving alarm/event information and start listening (supports multiple threads).

### API Definition

```
LONG NET_DVR_StartListen_V30(
    char          *sLocalIP,
```

```
WORD      wLocalPort,  
MSGCallBack DataCallback,  
void      *pUserData  
);
```

### Parameters

#### sLocalIP

[IN] IP address of local PC. It can be set to null.

#### wLocalPort

[IN] Listening port No. of local PC. It is configured by user, and it should be the same with that of device.

#### DataCallback

[IN] Alarm/event information callback function, see details in [MSGCallBack](#).

#### pUserData

[IN] User data.

### Return Values

Return -1 for failure, and return other values for the handle parameters of

#### [NET\\_DVR\\_StopListen\\_V30](#)

If -1 is returned, you can call [NET\\_DVR\\_GetLastError](#) to get the error code.

The available error codes of this API are 0, 3, 6, 12, 17, 41, 44, 47, 72, and 75. See details in the [Device Network SDK Errors](#).

### Remarks

- To receive the alarm/event information sent by device, you should set the management host server address or listening host server address of device to the IP address of PC (which is same with the **sLocalIP**), or set the management host server port or listening host server port to the listening port No. of PC (which is same with the **wLocalPort**).
- The callback function in this API is prior to other callback functions, that is, if the callback function is configured in this API, other callback functions will not receive the alarm information. All the device alarm information is returned in same callback function, and you can distinguish the devices via the alarm device information (**pAlarmInfo**).

## 10.27 NET\_DVR\_StopListen\_V30

Stop listening (supports multiple threads).

### API Definition

```
BOOL NET_DVR_StopListen_V30(  
    LONG  lListenHandle  
)
```

## Parameters

### **IListenHandle**

Listening handle, which is returned by [NET\\_DVR\\_StartListen\\_V30](#).

## Return Values

Return *TRUE* for success, and return *FALSE* for failure.

If *FALSE* is returned, you can call [NET\\_DVR\\_GetLastError](#) to get the error code.

The available error codes of this API are 0, 3, 12, and 17. See details in the [Device Network SDK Errors](#).

#### Members

##### dwSize

Structure size.

##### byID

Stream ID, which consists of letters, digits, and dashes, 0-invalid.

##### dwChannel

Linked device channel. When it is 0xffffffff, if setting the stream source, this parameter indicates that no device channel is linked; if setting configuration condition, this parameter is invalid.

**byRes**

Reserved, set to 0.

**Remarks**

- If the device does not support marking stream ID, e.g., DVR, the parameter **byID** should be set to 0.
- For transcoder, when setting the stream source, only one of **byID** and **dwChannel** can be valid; when transcoding, both the **byID** and **dwChannel** can be invalid, the transcoding channel or stream ID is automatically allocated by device.
- For other devices (e.g., CVR), when this structure is inputted as configuration condition, if both the **byID** and **dwChannel** are invalid, error code (17) will be returned, if they are valid, but mismatched, error may also be returned, so only setting one of these two parameters is suggested.

## A.5 Response Codes of Text Protocol

The response codes returned during the text protocol integration is based on the status codes of HTTP. 7 kinds of status codes are predefined, including 1 (OK), 2 (Device Busy), 3 (Device Error), 4 (Invalid Operation), 5 (Invalid Message Format), 6 (Invalid Message Content), and 7 (Reboot Required). Each kind of status code contains multiple sub status codes, and the response codes are in a one-to-one correspondence with the sub status codes.
